Drought?

Making Efficient Use of Limited Moisture; The Planning Starts Now

Leland McDaniel
OSU Extension
Oklahoma’s Annual Precipitation History 1895 to 2012.

- Dust Bowl
- Worst OK Drought
- 30 Yr. wet cycle
- 05-06 Drought
- 11-12 Drought

Annual Precipitation History with 5-year Tendencies
Oklahoma Statewide: 1895-2012

droughtmonitor.unl.edu
A Texas study in 1958 found that it takes about 20 inches of water to produce one ton of un-fertilized Bermuda.

Under high fertility it only took 4 inches per ton.

Research conducted by Fisher and Caldwell, Texas A&M University
## Effect of Nitrogen Fertilizer on Hay Production and Water Utilization by Midland 99 Bermudagrass @ ERS- 2012

It’s More Than Just Nitrogen

Of main concern are the Primary Macronutrients:

- N = Nitrogen
- P = Phosphorus
- K = Potassium
It’s More Than Just Nitrogen

Automobile analogy:
• (N) Nitrogen = Fuel
• (P) Phosphorus = Oil
• (K) Potassium = Engine Coolant
It’s More Than Just Nitrogen

Nitrogen Use Efficiency:

• Without adequate levels of phosphorus and potassium, we cannot burn the full tank of nitrogen.
  • Some of the nitrogen remains unavailable to the plants
  • Reduced plant growth/yield
  • Wasted money
It’s More Than Just Nitrogen

Nitrogen Use Efficiency:

• Simply adding more nitrogen, if phosphorus and/or potassium are deficient, will not maximize yield or growth.

Justus von Liebig’s “Law of the Minimum” published in 1873

“If one growth factor/nutrient is deficient, plant growth is limited, even if all other vital factors/nutrients are adequate…plant growth is improved by increasing the supply of the deficient factor/nutrient”
It’s More Than Just Nitrogen

Soil pH Also Affects Nutrient Availability:

- If pH is too high or too low, nutrients become bound up in complex compounds and availability to the plants is limited.

SOURCE: https://www.emporiumhydroponics.com/what-is-ph-1-to-14
It’s More Than Just Nitrogen

Automobile analogy:

• (N) Nitrogen = Fuel
• (P) Phosphorus = Oil
• (K) Potassium = Engine Coolant
• pH = Tire Air Pressure
It’s More Than Just Nitrogen

Soil Testing Tells Us Which and How Much Fertilizer To Apply:

- Soil testing = checking the gauges

\[ \text{Nitrogen} + \text{Phosphorus} + \text{Potassium} = \text{Soil pH} \]
Long Term P Study (8/12)
7/24/12 – 57 days growth

Bermuda = 31%
WS Grasses = 36%
Broadleaf = 33%

1,290 lbs/acre

No fertility
9.25” avg. height
Long Term P Study (8/12)

This was with 2.97” of rainfall!!!
N Source Effects On Yield
Kinta, OK 2005
Brian Pugh & Chris Rice

Statistically no significant differences!
Plots harvested on Oct 17th

Application of 100 units N – 294 lb/ac amm. nitrate, 217 #/ac urea, or 217 lb/ac of urea+Agrotain.
Old-world Bluestems

Introduced – Eurasia, India, et al.

Requires fertility!!

Stephens Co. – B. Dahl
Aug. 5 - fertilizer applied following baled

- 50, 75 and 100# actual N/ac
- 40# P$_2$O$_5$/ac per soil test
- Potassium & pH adequate
- 48-day forage accumulation:
  - Control = 3,121 lbs./ac
  - 50# N = 5,135 lbs./ac (2,014# fertilizer response)
  - 75# N = 5,714 lbs./ac (2,593# fertilizer response)
  - 100# N = 5,906 lbs./ac (2,785# fertilizer response)
Fertility Management during Drought

- Introduced forages
  - P for root growth.
  - N at greenup/prior to rainfall.
  - Additional N based on soil moisture.
  - K for drought tolerance
Moisture Efficient
WS Annuals

Some grasses are naturally more drought tolerant than others. This can result from a more efficient root system or from a reduced transpiration rate. Crabgrass is a great example of a high moisture forage that even when Bermuda browns out will still be green. Teff is another that can withstand dry weather while making high quality hay and/or forage.
Native Grass Adaptability
How can we make more efficient use of rainfall?

- Native grasses
- Adapted under wetting and drying cycles for thousands of years
- Will take some management to maintain a healthy stand
- Stocking rate!
- Standing winter forage
- Very deep rooted and therefore able to extract deep soil moisture
- Could go a long way to forage needs during a drought
  - 2012 – 5.6 tons
  - 2013 – 7.4 tons
  - 2014 – 6.9 tons
  - 2015 – 8.2 tons (no fire)
Bermuda – May 18th, 2016
1,888 lbs / A
Switchgrass – May 18th, 2016
6,244 lbs / A
Fertility??

Key Points:
• No fertilizer was more profitable than 100-0-0
• Adding phosphorus per soil test improved economics
• Profitability will vary with cattle and fertilizer markets
• Adding P to enhance long-term productivity?
• Weed response to fertility
  • Need good range condition and/or weed control

Native Range

Table 1. Effect of fertilizer rate on yield and profitability ranking of native grass at two Oklahoma locations (two-year average 2008-09)

<table>

Yields followed by the same letter are not statistically different at the 5 percent level of probability.

NRI; 2008-2009
Grazing/Mowing Height
How can we make more efficient use of rainfall?

- Many producers over graze and mow hay fields too short and this halts growth...reducing yield over the season
- Open canopies tend to see higher soil temps and therefore increased evapotranspiration rates
- This management technique also tends to reduce the root system mass, reducing the ability of plants to harvest moisture from the soil profile
Clipping height and frequency effects on plant yield

Yield per pot (grams)

- **Above ground**
- **Roots**

**Clipping treatment**
- 2 inch/14 day
- 2 inch/28 day
- 6 inch/14 day
- 6 inch/28 day
Harvest Deferment during Drought

- Don’t graze too early!
- Allow at least 4 to 5 weeks of uninterrupted growth.
- Maintain a critical stubble height
  - Bermudagrass – no less than 3 inches
  - Fescue – 4-6”
  - Native – 6” minimum!
Just as “it takes money to make money.”

It takes grass to grow grass; leaves are the plants’ solar panels.

- How do we manipulate forage DM yields and mitigate impacts of drought?
  1. Fertility
  2. Grazing/harvest management
